## **CLAIMS:**

- 1. -9. (Cancelled)
- 10. (Currently Amended) A high-strength bolted connection structure substantially without needs of a fire protection, said bolted structure comprising at least one of each columns and beams made of fire resistant steel, wherein said column and said beams are connected with

ultra-high-strength bolts that provide additional fire resistance to the connection structure, each of the bolts having a bolt tensile strength of at least  $1200 \text{ N/mm}^2$  at a room temperature, and wherein the ratio of a effective cross-sectional area of a bolt thread (bAs) to a correctional area of bolt shank (bAs) is  $\geq 0.8$ , and wherein the ratio of bolt tensile strength at 650 C (TSt) to the bolt tensile strength at room temperature (TS) satisfies the following inequality:

$$TSt/TS \ge (0.675 \times \sqrt{3} \times \mu / \nu) \times bAe/bAs$$

\_the fire resistance with a bolt shear-proof stress at 650°C satisfying the following inequality:

$$b \Box t \ge \mu \times N_e / (\nu \times bAs)$$

where where

b □ t is the bolt shear proof stress, such that  $b\tau t = TSt/\sqrt{3}$ ,

TSt is the tensile strength of the bolts-at a predetermined high temperature,

μ is a coefficient of slip at the room temperature,

N<sub>o</sub> is a design-bolt tension,

v is safety factor for a long-term load, and

bAs is a cross-sectional area of a-bolt shank.

11. (Currently amended) The bolted connection structure according to claim 10,

NY02:571693.1 2

wherein at least one particular beam of the beams has a long-term allowable shear force at the room temperature (Os), which satisfies the following:

$$Qs \le \{ns \times TS + (nf - ns) \times TSt\} \times (1/\sqrt{3}) \times \mu/\nu \times bAs$$
, and

$$Qs \leq \{ns \times b\tau + (nf - ns) \times b \Box t\} \times bAs$$
, and

wherein:

Qs is a long-term allowable shear force of the particular beam at the room temperature, such that  $Qs = fs \times Ab$ , where

fs is an particular long-term allowable shear proof stress of the beam,

Ab is a cross-sectional area of the particular beam,

ns is a number of tension bolts in a floor slab on an upper flange side of the particular beam,

b is a shear proof stress of bolt at the room temperature, such that  $b\tau = TS/\sqrt{3}$ , TS is a tensile strength of the bolts at the room temperature, and nf is a number of tension bolts on the upper flange side of the particular beam.

12. (previously presented) The bolted connection structure according to claim 10, further comprising:

sets of a high-strength bolt, a nut, a washer and joint metals, wherein the nut is a general structural hexagon nut, and the washer is a structural high-strength plain washer, and wherein no fire resistance is provided for the nut and the washer.

13. (previously presented) The bolted connection structure according to claim 10, further comprising:

NY02:571693.1

sets of a high-strength bolt, a nut, a washer and joint metals, wherein at least a portion of the joint metals are composed of a steel material having a predetermined high-temperature strength.

14. (Previously Presented) The bolted connection structure according to claim 10, wherein at least a portion of at least one of the columns and the beams used is composed of a steel material having a predetermined high-temperature strength.

15. (previously presented) The bolted connection structure according to claim 10,

wherein at least one particular bolt of the high-strength bolts is an ultra-high-strength bolt which contains approximately, in % by weight, C:  $0.30 \sim 0.45\%$ , Si: less than 0.10%, Mn: more than  $0.40\% \sim$  less than 1.00%, P: less than 0.010%, S: 0.010% or less, Cr: 0.5% or more  $\sim$  less than 1.5%, Mo: more than  $0.35\% \sim$  less than 1.5%, V: more than  $0.3\% \sim 1.0\%$  or less, with the balance being Fe and unavoidable impurities, and which has the fire resistance and a particular resistance to a delayed fracture such that following relations are satisfied:

$$TS \le (1.1 \times T + 850)$$
, and

$$TS \le (550 \times Ceq + 1000),$$

wherein:

TS is a tensile strength of the particular bolt at the room temperature,

T is a tempering temperature, and

Ceq is carbon equivalent, such that

$$Ceq = C + (Mn/6) + (Si/24) + (Ni/40) + (Cr/5) + (Mo/4) + (V/14).$$

16. (previously presented) The bolted connection structure according to claim 12, wherein the high-strength bolt is an ultra-high-strength bolt which contains approximately, in % by weight,

NY02:571693.1 4

C:  $0.30 \sim 0.45\%$ , Si: less than 0.10%, Mn: more than  $0.40\% \sim$  less than 1.00%, P: less than 0.010%, S: 0.010% or less, Cr: 0.5% or more  $\sim$  less than 1.5%, Mo: more than  $0.35\% \sim$  less than 1.5%, V: more than  $0.3\% \sim 1.0\%$  or less, with the balance being Fe and unavoidable impurities, and which has the fire resistance and a particular resistance to a delayed fracture such that following relations are satisfied:

$$TS \le (1.1 \times T + 850)$$
, and

$$TS \le (550 \times Ceq + 1000),$$

wherein:

TS is a tensile strength of the high-strength bolt at the room temperature,

T is a tempering temperature, and

Ceq is carbon equivalent, such that

$$Ceq = C + (Mn/6) + (Si/24) + (Ni/40) + (Cr/5) + (Mo/4) + (V/14).$$

17. (previously presented) The bolted connection structure according to claim 13, wherein the high-strength bolt is an ultra-high-strength bolt which contains approximately, in % by weight, C:  $0.30 \sim 0.45\%$ , Si: less than 0.10%, Mn: more than  $0.40\% \sim$  less than 1.00%, P: less than 0.010%, S: 0.010% or less, Cr: 0.5% or more  $\sim$  less than 1.5%, Mo: more than  $0.35\% \sim$  less than 1.5%, V: more than  $0.3\% \sim 1.0\%$  or less, with the balance being Fe and unavoidable impurities, and which has excellent fire resistance and resistance to delayed fracture such that following relations are satisfied:

$$TS \le (1.1 \times T + 850)$$
, and

$$TS \le (550 \times Ceq + 1000),$$

wherein:

NY02:571693.1 5

TS is a tensile strength of the high-strength bolt at room temperature,

T is a tempering temperature, and

Ceq is carbon equivalent, such that

$$Ceq = C + (Mn/6) + (Si/24) + (Ni/40) + (Cr/5) + (Mo/4) + (V/14).$$

18. (previously presented) The bolted connection structure according to claim 14,

wherein at least one of the bolts is an ultra-high-strength bolt which contains approximately, in % by weight, C:  $0.30 \sim 0.45\%$ , Si: less than 0.10%, Mn: more than 0.40%  $\sim$  less than 1.00%, P: less than 0.010%, S: 0.010% or less, Cr: 0.5% or more  $\sim$  less than 1.5%, Mo: more than 0.35%  $\sim$  less than 1.5%, V: more than 0.3%  $\sim$  1.0% or less, with the balance being Fe and unavoidable impurities, and which has excellent fire resistance and resistance to delayed fracture such that following relations are satisfied:

$$TS \le (1.1 \times T + 850)$$
, and

$$TS \le (550 \times Ceq + 1000),$$

wherein:

TS is a tensile strength of the high-strength bolt at the room temperature,

T is a tempering temperature, and

Ceq is carbon equivalent, such that

$$Ceq = C + (Mn/6) + (Si/24) + (Ni/40) + (Cr/5) + (Mo/4) + (V/14).$$
